<i>Dialing configuration</i> .....	6

## Introduction

This page will guide you through configuration and basic use of the Horizon Integrator PerfectView Add-in. It is expected that you are already familiar with the Address Book, Call History and Preview window, and the basic concepts of integration and screen popping using the Add-ins. See the 'User Guide' for these topics.

PerfectView and the database used to store your contact data should already be installed and working normally before proceeding with this integration.

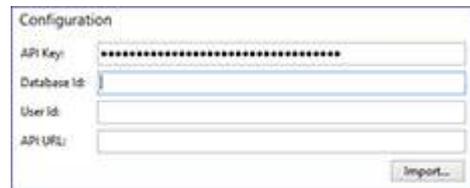

Horizon Integrator must also be installed already with the initial configuration completed. If this is not the case, please see the 'Technical Installation Guide' or consult your system administrator.

## Configuration

Right-click the Horizon Integrator tray icon in the system tray menu and then left-click the 'Configuration' option from the menu that pops up, this will open the 'configuration' screen. In the 'Integration' area, click the 'Add new' button, select 'PerfectView' from the 'Type' dropdown box and then click the 'Set' button.

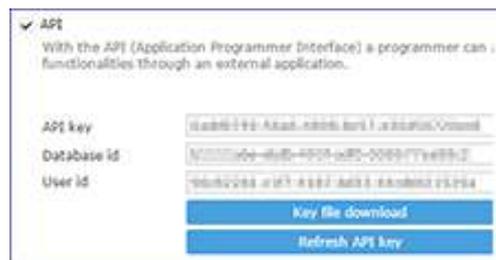

On the 'Configuration' group, enter the API Key, Database ID and User ID which can be found within PerfectView when logged into PerfectView.

In PerfectView select the settings icon which can be found on the right-hand side of the screen then select the 'Modules' option.

Next click the 'Key file download' button which will download the information to an .xml file (PerfectView Api Credentials) which will need to be saved temporarily to a known location. This file will contain the API Key, Database ID and User ID and the API URL which will need to be imported onto the 'Configuration' group. On the 'Configuration' group

click 'Import' and select the PerfectView API Credentials.xml file to import.

Click the 'Save' button to store the information you've entered and apply the configuration.

## Testing

To test if the configuration worked, enter a phone number from your PerfectView account into the 'Telephone' box in the 'Integration test' area and click the 'Search' button. The results will be displayed after a few seconds.

A screenshot of the 'Integration test' form. It has a title 'Integration test' at the top. Below it is a 'Telephone:' label followed by a text input field and a 'Search' button. Underneath is a 'Result:' label followed by a large, empty text area. At the bottom, there is an 'Actions:' label followed by a 'Show contact' button.

If the test does not work, go to the 'Log' page of configuration and turn on logging, then do the test again and see if there are any errors in the log.

## Dialing configuration

To dial out from within PerfectView, dialing needs to be configured correctly.

Right-click the Horizon Integrator tray icon in the system tray menu and then left-click the 'Configuration' option from the menu that pops up, this will open the 'configuration' screen. In the 'General' group, click on the 'Dialing' option.

A screenshot of the 'Dialing configuration' screen. At the top, it says 'Select the methods of dialing to use:' followed by four checkboxes: 'Clipboard dialing', 'Application dialing', 'Focus dialing', and 'Dialing handlers...'. Below this is a section titled 'Select the applications and web sites to use dialing from' which contains a table with columns 'Type', 'Application/Domain', 'Form/Page', and 'Textbox'. Under the table are buttons for 'Add', 'Edit', 'Remove', 'Import', and 'Export'. The 'Add' button is highlighted with a red box. At the bottom, there is a section 'Choose the criteria to use when searching for valid numbers' with input fields for 'Minimum length', 'Maximum length', and 'Must start with', along with an 'Advanced rules...' button.

Please see the following link to make sure that the web dialing feature is enabled before progressing: <http://integrator.unlimitedhorizon.co.uk/help/help.php?item=1119&lang=uk>

You can refine the criteria used to identify telephone numbers. Enter the appropriate number of digits into the 'Minimum length' and 'Maximum length' text boxes and specify a prefix that identifies telephone numbers (if there is one) by entering it in the 'Must start with' box.

If you would like to be able to dial directly when you are entering new information in PerfectView, for example on the new contact page, we need to carry out some further configuration. Click the 'Add' button to start the Dialing wizard.

The first question in the wizard asks you about the type of application you want to dial from. Select the 'The application runs inside a web browser' option. Click the 'Next' button.

This is a screenshot of the first step in a wizard titled "Dialling: Internet application". The text explains that you can configure dialling from a web browser for two types of presentation: "Read only telephone numbers such as might appear in a list or directory" and "text boxes such as might appear in a CRM package". It asks the user to select the type they want to configure, noting that only Internet Explorer is supported. There are two radio button options: "Read only telephone numbers (hyperlinks)" and "Text boxes", with the latter being selected. At the bottom right, there are "Back" and "Next" buttons.

We've already covered converting identified numbers into hyperlinks so select the 'Text boxes' option on the second screen of the wizard and click the 'Next' button.

This is a screenshot of the second step in the wizard, titled "Dialling: Internet application: Text box". It explains that a detection process is used to learn the application and confirm it is possible to dial from it. It provides instructions: "To proceed, then: 1) Load the application and get it to a stage where you can see the text box you would like to dial from. 2) Enter the telephone number that presently appears in the application's text box into the space below. 3) Press 'Detect'". Below the instructions is a text input field labeled "Number to search for:". At the bottom right, there are "Back" and "Detect" buttons.

Open your PerfectView account in Internet Explorer and find the text box you want to dial out from, it needs to have a number in it already so add a temporary one if you need to. Copy or make a note of the telephone number currently displayed in the text box and leave the web page open.

Back in the wizard, paste or type the number into the 'Number to search for' box and click the 'Detect' button.

This is a second screenshot of the "Dialling: Internet application: Text box" wizard screen. It is identical to the previous screenshot, showing the instructions and the "Number to search for:" input field. The "Detect" button is highlighted in blue, indicating it has been clicked.

The wizard will search the current web page for the telephone number you entered and, once found, display the details. Click 'Next' and then 'Close'.

You can add as many textboxes as you like, just start the process by clicking the 'Add' button and working your way through again.

Click 'Save' to store your settings and you're ready to go. Now, a clickable icon is placed at the end of any textboxes you have configured and you just click on it to dial the number in the textbox.
